

# What are DWHRS?

DWHRs (Drain Water Heat Recovery Systems) are a simple addition to your water drainage pipe that transfers heat from warm water going down the drain to cold water going into your water heater. They are most useful in houses where hot water use is high.

## Steps

1. Do the research! Buy an efficient product, longer pipes transfer more heat and are more efficient.
2. Choose a product recognised by Natural Resources Canada.
